DETAILED ACTION

Claims 1–22 are pending.

Election/Restrictions

Restriction to one of the following inventions is required under 35 U.S.C. 121:

5 I. Claims 1–13 and 18–19, drawn to a polypeptide consisting of up to 13 consecutive amino acids selected from the amino acid sequence identified as SEQ ID NO:12, SEQ ID NO:19, and containing the sequence identified as SEQ ID NO:18, classified in class 530, subclass 350.

10 II. Claims 14–17 and 20–22, drawn to a polynucleotide encoding a polypeptide consisting of up to 13 consecutive amino acids selected from the amino acid sequence identified as SEQ ID NO:12, SEQ ID NO:19, and containing the sequence identified as SEQ ID NO:18, classified in class 536, subclass 23.5.

The inventions are distinct, each from the other because of the following reasons:

The polypeptide of group I and polynucleotide of group II are patentably distinct inventions for the following reasons. Polypeptides, which are composed of amino acids, and polynucleotides, which are composed of purine and pyrimidine units, are structurally distinct molecules; any relationship between a polynucleotide and polypeptide is dependent upon the information provided by the nucleic acid sequence open reading frame as it corresponds to the primary amino acid sequence of the encoded polypeptide. While a polypeptide of group I can be made by methods using the polynucleotides that fall within the scope of group II, it can also be made through chemical synthesis. For these reasons, the inventions of groups I and II are patentably distinct. Furthermore, searching the inventions of groups I and II together would

impose a serious search burden. In the instant case, the search of the polypeptides and the polynucleotides are not coextensive. The inventions of Groups I and II have a separate status in the art as shown by their different classifications. In cases such as this one where descriptive sequence information is provided, the sequences are searched in appropriate databases. There is

5 search burden also in the non-patent literature. Prior to the concomitant isolation and expression of the sequence of interest there may be journal articles devoted solely to polypeptides which would not have described the polynucleotide. Similarly, there may have been "classical" genetics papers which had no knowledge of the polypeptide but spoke to the gene. Searching, therefore is not coextensive. As such, it would be burdensome to search the inventions of groups

10 I and II together.

Because these inventions are distinct for the reasons given above, have acquired a separate status in the art as shown by their different classification, and the search required for each group is not required for the other groups because each group requires a different non-patent literature search due to each group comprising different products and/or method steps,

15 restriction for examination purposes as indicated is proper.

Applicant is advised that the reply to this requirement to be complete must include (i) an election of a species or invention to be examined even though the requirement be traversed (37 CFR 1.143) and (ii) identification of the claims encompassing the elected invention.

The election of an invention or species may be made with or without traverse. To reserve

20 a right to petition, the election must be made with traverse. If the reply does not distinctly and specifically point out supposed errors in the restriction requirement, the election shall be treated as an election without traverse.

Art Unit: 1647

Should applicant traverse on the ground that the inventions or species are not patentably distinct, applicant should submit evidence or identify such evidence now of record showing the inventions or species to be obvious variants or clearly admit on the record that this is the case. In either instance, if the examiner finds one of the inventions unpatentable over the prior art, the

5 evidence or admission may be used in a rejection under 35 U.S.C.103(a) of the other invention.
